Simple and approximate expressions for the radiated electric field components of a microstrip antenna are given by Carver and Mink (1981): $E_{\theta} = j \frac{V_0 k_0 W e^{-j k_0 r}}{r} \cos \theta \cos (k_0 r d \cos \theta) \times \sin (k_0 \sin \theta \sin W / 2) k_0 \sin \theta \sin W / 2 \cos (k_0 L / 2 \sin \theta \cos \theta); 0 \leq \theta \leq \pi / 2$.

The microstrip antenna (MSA) is a resonant structure that consists of a dielectric substrate sandwiched between a metallic conducting patch and a ground plane. The MSA is commonly excited using a microstrip edge feed or a coaxial probe. The canonical forms of the MSA are the rectangular and circular patch MSAs.

Advanced techniques needed to analyze antenna systems are studied in detail. Fourier transforms are reviewed and applied to antenna theory and array distributions. The method of moments is studied and used to solve basic integral equations employing different basis functions. Green's functions for patch antennas are formulated in terms of Sommerfeld-like integrals.

Coupling simulation of two microstrip patch antennas on Aircraft This test case deals with the coupling between two broad band microstrip antennas mounted on a generic aircraft. It shows the large savings in memory and computational time when using the FDTD-FEM solver compared to standalone FDTD solvers when parts of the geometry need a much finer grid than needed to resolve the wavelength in the problem.

We propose a novel design of internal impedance matching networks for axial-mode helical antennas. This network comprises a single wire attached to the helix. One of the main challenges when designing an internal matching network is its strong electromagnetic coupling with the antenna. The matching network must hence be designed in the presence of the antenna, which slows down the design process.

Design of Internal Wire-Based Impedance Matching of ...
In telecommunication, a microstrip antenna usually means an antenna fabricated using photolithographic techniques on a printed circuit board. It is a kind of internal antenna. They are mostly used at microwave frequencies. An individual microstrip antenna consists of a patch of metal foil of various shapes on the surface of a PCB, with a metal foil ground plane on the other side of the board. Most microstrip antennas consist of multiple patches in a two-dimensional array. The antenna is usually

A microstrip or patch antenna is a low profile antenna that has a number of advantages over other antennas. Microstrip antenna found application in different fields due to its compact size. Akin to the two sides of a coin, a patch antenna also has some drawbacks. Bandwidth and gain being the two most important factors of an antenna is low for patch antennas. There are many ways to solve this problem but each of them leads to another problem which requires
